

ADVANCED TECHNOLOGY RESTORES DETERIORATING FACIAL

An estimated 150 million people around the world experience problems associated with missing teeth, such as inability to smile with confidence, difficulty in chewing, talking or laughing and embarrassment in eating in public.

Complete tooth loss leads to collapse of facial structures, dramatically affecting a person's appearance. Wrinkles in the lips and cheeks develop as the mouth collapses. In extreme cases, as the jawbone continues to deteriorate, or resorb, facial muscles change, causing the chin and nose to curve inward towards each other, resulting in a "witch's beak" appearance. Wearing dentures actually accelerates this deterioration of the facial structures.

The solution is dental implant treatment, today's state-of-the-art alternative to traditional methods of tooth replacement. Unlike bridges, partials and dentures, which do not address

Consultant at Fortis Hospitals and Swiss Smile Clinics

Consultant-Dental Legal Advisor and Auditor

Clinical Director for Dental Implant Training Courses, Rehabilitative & Aesthetic Dentistry

By preventing the bone resorption that would normally occur with tooth loss, dental implants preserve the integrity of the facial structures.

the deterioration of the jaw bone, dental implants prevent the loss of the jaw bone that occurs when teeth are missing.

As substitute tooth roots, dental implants provide virtually the same function as natural tooth roots : simulation of bone regeneration to preserve the facial structures, and a stable foundation for the replacement teeth that look, feel and function like natural teeth.

"Combining implant treatment with advances in bone regenerative techniques, it is even possible to provide a 'internal facelift' for patients who have already experienced deterioration of their facial structures," states Dr. Sandhya Ramanujam (Head of Dental Center, Fortis Hospitals and Clinical Director of 'Perfect
